
Configure SD-WAN Certificates

For supported software information, click [here](#).

A certificate authority (CA) is a trusted third-party organization that issues electronic documents, called digital certificates. A CA certificate is a small data file issued by a CA that verifies a digital entity's identity on the internet and indicates that the website is secured using an encrypted connection. CA certificates are an essential part of secure communication.

Versa Networks provides a set of self-signed trusted certificates that enable secure data transfer between web servers and the clients using secure socket layer (SSL) encryption. You can also add additional certificates, such as certificates for LDAP and IPsec tunnels.

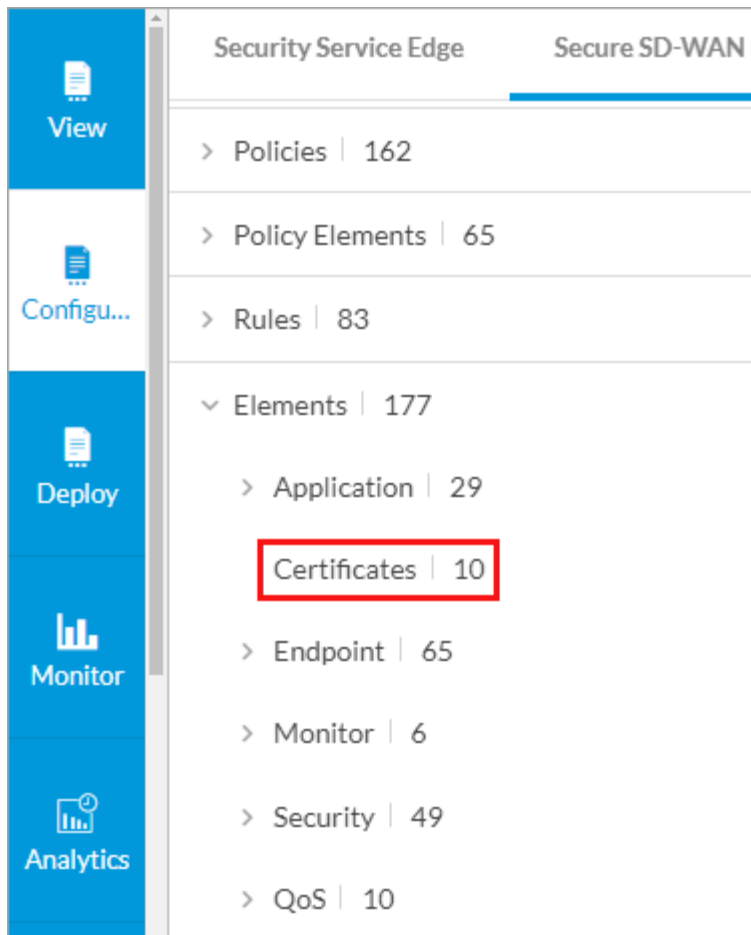

A CA chain is an ordered list of the CA certificates for all trustworthy intermediate and end devices in a communications chain.

A private key is required to access secured traffic using a certificate. To secure the traffic on a Versa Operating System™ (VOS™) device, you can use either a self-signed CA certificate or a trusted CA certificate.

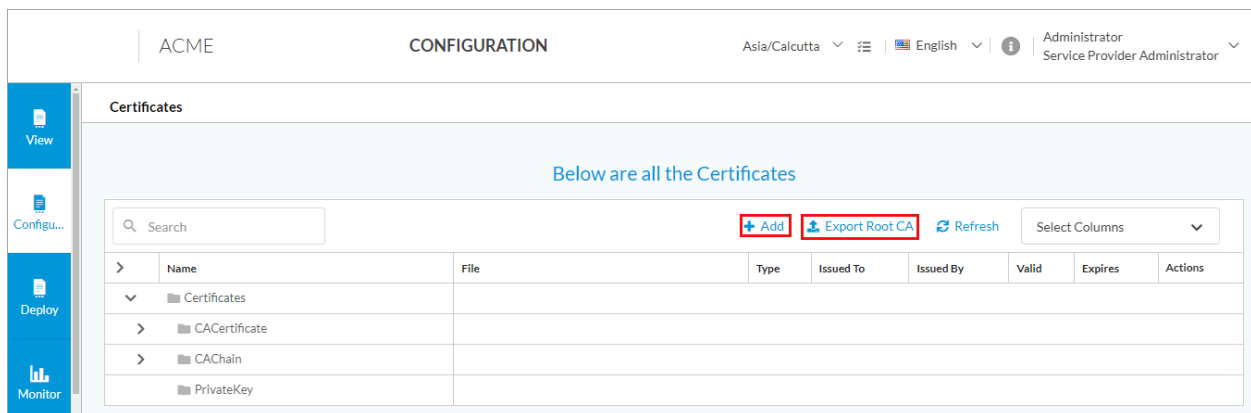

This article describes how to upload a CA certificate, a CA chain, and a private key file to the Concerto node.

To configure certificates and a private key file:

1. Go to Configure > Secure SD-WAN > Profile Elements > Elements > Certificates.

The Certificates screen displays all currently available certificates, including the default Versa Cert certificate, which is supplied by Versa Networks, and the Versa CA Chain.

2. Click + Add to add certificates. The Add CA Certificate popup window displays.

Add CA Certificate

Certificate Type
☒ CA Certificate
☐ CA Chain
☐ Key

The file to be uploaded needs to be in .zip format. They will consist of 2 files: a key and a certificate. The key file needs to have .key extension. There is no restriction on the extension of the certificate file.
