

Configure Maintenance Mode

 For supported software information, click [here](#).

You can enable a Versa Operating System™ (VOS™) device to operate in maintenance mode so that you can perform administrative tasks, such as upgrading the software on the device. When a VOS device is in maintenance mode, other devices are expected to route traffic around the VOS device that is in maintenance mode.

When a VOS device is in maintenance mode, the routing protocols behave as follows:

- BGP appends the well-known community of 65535:0 (GRACEFUL_SHUTDOWN) to the routes advertised by the VOS device. When another VOS device or a router receives a route with this community, the devices set the local preference of the route to 0. Routes with a preference value of 0 are considered to be the least preferred. Note that you can create an import policy to override this local preference value. You can also create a routing peer policy that uses the 65535:0 community as a match condition, as illustrated in the following screenshot:

The screenshot shows a configuration window titled "Edit BGP Instance Edit Peer/Group Policy Edit Term". The "Match" tab is active. The "Term Name" field is set to "Allow-All". The "Match" section includes several fields: "Family" (dropdown), "AS Path" (text), "Metric" (text), "NLRI" (dropdown), "Source Address" (dropdown), "Nexthop" (dropdown), "Well Known Community" (dropdown, highlighted with a red box and containing "graceful-shutdown"), "Community" (text), "Extended Community" (text), and "Origin" (dropdown). The "SLA Profile" section includes "Name" (dropdown), "Nexthop Name" (dropdown), and "Local Circuit Name" (dropdown). The "Nexthop List" and "Local Circuit List" sections each have a checkbox and a list of items with add and delete icons. The "OK" and "Cancel" buttons are at the bottom right.

- OSPF sets the router LSA metric to 65535, which causes other routers to select alternate VOS devices or routers for forwarding.
- PIM announces a designated router (DR) priority value of 0 so that other PIM routers are more preferred to become the designated router.
- All VRRP groups, except the special groups configured with a priority of 255, are placed into INIT state. As a result, hosts do not use the VOS device for forwarding.

Configure Maintenance Mode

1. In Director view:
 - a. Select the Configuration tab in the top menu bar.
 - b. Select Devices > Devices in the horizontal menu bar.
 - c. Select a Controller or VOS device in the main pane. The view changes to Appliance view.
2. Select the Configuration tab in the top menu bar.
3. Select Others > System > Configuration > Configuration in the left menu bar.
4. In the main pane, locate the Maintenance Mode pane.
